MINERALOGY

12

Raman Spectroscopy

applied to Earth Sciences and Cultural Heritage

Editors

J. DUBESSY, M.-C. CAUMON and F. RULL

EUROPEAN MINERALOGICAL UNION
NOTES IN MINERALOGY

Series editor: Giovanni Ferraris

Volume 12

**APPLICATIONS OF RAMAN
SPECTROSCOPY TO EARTH
SCIENCES AND CULTURAL
HERITAGE**

UNIVERSITY TEXTBOOK

Edited by

J. Dubessy, M.-C. Caumon and F. Rull

Published by the European Mineralogical Union and the
Mineralogical Society of Great Britain & Ireland
London, 2012

The publication of this textbook and the organization of the related school were sponsored by the European Mineralogical Union

EMU Notes in Mineralogy

A series published under the auspices of the European Mineralogical Union (EMU) in connection with the *EMU Schools meetings*.

Initiator of the EMU Schools and the EMU Notes in Mineralogy
Giovanni Ferraris, Torino, President of the EMU 1992–1996

Series Editor: Giovanni Ferraris, Torino (previous editors: Tamás G. Weiszbürg and Gábor Papp, Budapest)

Editor of this Volume
J. Dubessy, M.-C. Caumon, Université de Lorraine, Nancy, France, and F. Rull, Universidad de Valladolid, Spain

Technical Editor and Indexer: Kevin Murphy, London

Front cover design: Michel H. Guay

Executive Committee of the EMU (2008–2012)
Roberta Oberti, Pavia (President), Peter Ulmer, Zurich (Past-President), Christian Chopin, Paris (1st Vice President), F. Gervilla, Granada (2nd Vice President), Herta Effenberger, Vienna (Secretary), Ernst Burke, The Netherlands (Treasurer)

On the front cover: Metastable assemblage of albite crystals, silicate melt globules and aqueous fluid at 600°C, 1.06 GPa in the sample chamber of a hydrothermal diamond-anvil cell: bulk composition H₂O + 54 wt.% NaAlSi₃O₈, zircon chip added as Raman spectroscopic pressure sensor; the sample chamber diameter is ~ 400 μm. The editors thank C. Schmidt, GFZ for providing the photograph and Raman spectrum.

Copies of the EMU Notes (volumes 1–7) are distributed in Europe by the larger member societies of the European Mineralogical Union:

Società Italiana di Mineralogia e Petrologia:
www.socminpet.it

Mineralogical Society of Great Britain & Ireland:
www.minersoc.org

Société Française de Minéralogie et de Cristallographie:
www.sfmc-fr.org

and by the Secretary of the EMU, Prof. Herta S. Effenberger:
www.univie.ac.at/Mineralogie/EMU

in America by the Mineralogical Society of America:
www.minsocam.org

Institutional orders as well as individual requests from outside Europe and America should be sent also be sent to the the Secretary of the EMU, Prof. Herta S. Effenberger:
www.univie.ac.at/Mineralogie/EMU

For volumes 8 onwards, the Mineralogical Society of Great Britain acts as co-publisher and copies may be ordered from www.minersoc.org

or from:

Contents

Preface	XV
----------------------	----

Foreword	XVII
-----------------------	------

Chapter 1. The Raman effect and the vibrational dynamics of molecules and crystalline solids

by FERNANDO RULL	1
1. Introduction	1
2. The Raman effect	2
2.1. Elementary theory of Raman spectroscopy	2
2.2. Raman intensity	8
2.3. Raman band shape	10
3. Vibrational dynamics of molecules and crystalline solids	15
3.1. Introduction	15
3.2. Description of vibrations	16
3.3. Internal coordinates	21
4. Group theory applied to numbering of vibrations	23
4.1. Symmetry coordinates	23
4.2. A sample application: the AB ₂ molecule	31
5. Vibrations in crystals and lattice dynamics (phonons)	34
5.1. Lattice dynamics: the one-dimensional case	35
5.2. The dynamics of 3D crystals and vibrational spectroscopies	40
5.3. Classification of the normal modes of vibration for crystals	42
5.4. An example of the Raman-active-mode determination of a crystal	44
6. Other Raman effects	48
6.1. Resonance Raman spectroscopy	48
6.2. Coherent Anti-Stokes Raman spectroscopy (CARS)	49
6.3. Surface-enhanced Raman spectroscopy	50
6.3.1. SERS mechanism	51
6.3.2. Raman substrates and probes	52
6.3.3. Applications	52
Appendix	53
1. Representations of finite groups	53
2. Reduction of the representation	54
Acknowledgements	58
References	58

Chapter 2. Raman and fluorescence

by GÉRARD PANCZER, DOMINIQUE DE LIGNY, CLÉMENT MENDOZA, MICHAEL GAFT, ANNE-MAGALI SEYDOUX-GUILLAUME and XIAOCHUN WANG	61
1. Introduction	61

2. Principle of Raman and fluorescence	62
2.1. Raman – Theory	62
2.2. Luminescence – Theory	65
2.3. Luminescent centres	66
2.4. Black body and thermal incandescence	69
3. Different ways to reject fluorescence.....	69
3.1. Gated Raman spectroscopy	69
3.2. Monitoring the excitation wavelength	71
3.3. Polarization effects	73
3.4. Bleaching	75
3.5. FT-Raman	75
4. Taking advantage of simultaneous Raman and luminescence measurements	75
4.1. <i>REE</i> and uranyl ion substitutions in powellite and irradiation-induced defect.....	76
4.2. Thorium-induced auto irradiation in monazites and annealing	77
4.3. Conclusions	79
References.....	80

Chapter 3. Instrumentation in Raman spectroscopy: elementary theory and practice

by **JEAN DUBESSY, MARIE-CAMILLE CAUMON, FERNANDO RULL and SHIV SHARMA**

.....	83
1. Introduction	83
2. Characteristics of Raman spectra, instrument specifications and description of a Raman spectrometer	84
2.1. Main characteristics of Raman spectra and instrument specifications.....	84
2.2. The different elements of a Raman spectrometer.....	86
3. Excitation sources, spectrometers and detectors	87
3.1. Laser excitation sources	87
3.1.1. Main types of lasers	87
3.1.2. CW ionized gas lasers	88
3.1.3. Gas laser	89
3.1.4. Nd:YAG laser	89
3.1.5. Laser diodes or semiconductor lasers	89
3.1.6. Choice of laser excitation	91
3.2. Rejection of different types of stray radiations	92
3.3. Gratings used in dispersive Raman spectrometers	94
3.3.1. The grating equation	94
3.3.2. Angular dispersion of radiations by a grating and resolving power	98
3.3.3. Grating efficiency	99
3.3.4. The blaze angle	100

3.3.5. Influence of the polarization state of the incident radiation	100
3.3.6. Other types of gratings	101
3.4. Different types of dispersive spectrometers	104
3.4.1. Czerny-Turner spectrometers	104
3.4.2. Other types of spectrometers	107
3.5. The detectors	108
3.5.1. A brief history of detectors used in Raman spectroscopy.....	108
3.5.2. Detector parameters and sources of noise	108
3.5.3. Read-out noise	109
3.5.4. Background shot noise	110
3.5.5. Charge-coupled devices (CCDs).....	111
3.5.6. Other detectors	112
3.6. Sampling systems	113
3.6.1. Macroscopic sampling: conventional 90° or 180° geometries	113
3.6.2. Remote sampling system: fibre optic probes	113
3.6.3. Microspectrometers and spatial resolution with confocal and non-confocal Raman microscope	114
3.6.4. Axial resolution	114
3.6.5. Lateral resolution of conventional microscope	116
3.6.6. Lateral resolution of a confocal microscope	117
3.6.7. Sample heating by laser focus	117
3.6.8. Tip-enhanced Raman Spectroscopy (TERS)	118
3.6.9. Raman mapping and imaging	118
3.6.10. Polarization measurements	119
4. Calibrations.....	119
4.1. Raman shift: determination, accuracy, precision, calibration	119
4.1.1. Performances required for Raman-shift determination	119
4.1.2. Linear dispersion of Czerny-Turner spectrometers	120
4.1.3. Instrumental line profile	120
4.1.4. Spectral resolution	122
4.2. Radiometric calculations applied to spectrometers	124
4.2.1. Requirements for a luminous spectrometer	124
4.2.2. Optimum coupling conditions	125
4.2.3. Optical coupling of the microscope with the spectrometer	125
4.2.4. Flux of Raman photons collected by the entrance optics of the spectrometer	127
4.2.5. Flux of Raman photons reaching the detector.....	127
4.3. Experimental calibrations	128
4.3.1. Wavelength calibrations	128
4.3.2. Raman shift wavenumber calibration of a single Czerny-Turner spectrometer	128
4.3.3. Laser wavelength calibration	130

4.3.4. Intensity calibration	131
4.3.5. Spectral resolution	133
4.3.6. Confocality	135
5. Raman spectrometers: from the laboratory to the field.....	136
5.1. Field applications	143
5.2. <i>In situ</i> detection of organics in the field.....	149
6. Coupling with other techniques	149
6.1. Combined LIBS and Raman instrument.....	150
6.2. Combined time-resolved (TR) Raman-laser-induced native fluorescence (LINF)-LIBS instrument	157
6.3. Raman instruments for ocean studies	158
Acknowledgements.....	159
Definitions.....	159
References.....	165

Chapter 4. Theoretical modelling of Raman spectra

by RAZVAN CARACAS and EMA BOBOCIOIU	173
1. Introduction	173
2. Lattice dynamics and phonons.....	174
3. Phonon calculations using <i>ab initio</i> methods	180
3.1. Density functional theory	180
3.2. Density functional perturbation theory	181
3.3. Perturbation expansion	181
3.4. From mixed perturbations to physical properties.....	183
4. Raman tensors and Raman spectra	184
5. Examples	186
6. The WURM project	187
Acknowledgements.....	189
References.....	189

Chapter 5. Raman data analysis

by NICOLAE TARCEA and JURGEN POPP	193
1. Introduction	193
2. Data acquisition and storage	194
2.1. Data acquisition.....	194
2.2. Data storage organization	196
2.2.1. Raman spectra libraries	196
2.2.2. Files with header metadata.....	197
2.2.3. Relational databases	198
2.2.4. Graph databases	199
3. Pre-processing of Raman spectra.....	199
3.1. Spike removal	200
3.2. Spectra smoothing/denoising	200

3.3. Background correction	201
3.4. Normalization	202
3.5. Spectral and intensity (re-)calibration.....	202
4. Chemometry methods for Raman spectroscopy	206
4.1. Multivariate calibration algorithms.....	207
4.1.1. Multiple linear regression (MLR)	208
4.1.2. Principal component analysis (PCA)	208
4.1.3. Principal component regression (PCR) and partial least-squares regression (PLS)	210
4.2. Classification methods.....	212
4.3. Cluster analysis	214
References.....	217

Chapter 6. Optical cells with fused silica windows for the study of geological fluids

by I-MING CHOU	227
1. Introduction	227
2. High-pressure optical cell (HPOC)	228
2.1. Construction of HPOC	228
2.2. Sample loading and pressurizing procedures	228
2.3. Heating-cooling stages (USGS, INSTEC, Linkam)	231
2.4. Applications (examples)	234
2.4.1. Solubility and diffusion of methane gas in water	234
2.4.2. Solubility of methane hydrate in water	236
2.4.3. Determination of methane vapour pressure with measured Raman shift.....	238
2.4.4. Other applications	240
3. Fused silica capillary capsules (FSCCs)	241
3.1. Construction of FSCCs	241
3.2. Applications.....	241
3.2.1. Calibration standards.....	241
3.2.2. Other applications	242
4. Summary.....	243
Acknowledgements.....	245
References.....	245

Chapter 7. The Hydrothermal Diamond Anvil Cell (HDAC) for Raman spectroscopic studies of geological fluids at high pressures and temperatures

by CHRISTIAN SCHMIDT and I-MING CHOU	249
1. Introduction	249
2. Construction	250
3. Temperature measurement	252

4. Pressure measurement	254
4.1. Overview	254
4.2. Raman bands	256
4.3. Optical fluorescence lines	260
4.4. Phase-transition temperatures	264
5. Raman spectroscopic studies of geological fluids using diamond anvil cells.....	266
Acknowledgements.....	271
References.....	271

Chapter 8. Raman Spectroscopy of Gases, Water and other Geological Fluids

by **VALENTIN GARCIA-BAONZA, FERNANDO RULL and JEAN DUBESSY**..... 279

1. Introduction	279
2. Raman spectroscopy of gases	280
2.1. Raman scattering cross-section of gases and gas-phase composition calculation	280
2.2. Detection limit of gas analysis by Raman spectroscopy	283
2.2.1. Detection limit with a Raman microspectrometer.....	283
2.2.2. Detection limit of gas using a conventional spectrometer	285
2.3. Variation of the Raman scattering cross-section with temperature	285
2.4. Effect of density or pressure on Raman scattering cross-sections	285
3. Raman spectroscopy of water and aqueous solutions	288
3.1. Hydrogen bonding and water structure.....	290
3.2. Structural vs. spectroscopic models	294
3.3. Temperature and pressure effects	301
3.4. Aqueous solutions and hydrophobic effects	305
4. The H ₂ O-gas systems	310
4.1. Gas clathrates	310
4.2. H ₂ O-gas mixture at high temperatures and pressures	311
5. Applications of Raman spectroscopy to fluid geochemistry	313
Acknowledgements.....	314
References.....	314

Chapter 9. Raman Spectroscopy of Silicate Glasses and Melts in Geological Systems

by **STÉPHANIE ROSSANO and BJORN MYSEN**

1. Introduction	321
2. What is a glass?	322
2.1. Melts and melting	322
2.2. Transformation of melt to glass	325
3. Spectrum analysis.....	328

3.1. Pre-treatment of Raman spectra of glasses: background subtraction, temperature and frequency corrections, normalization	329
3.2. Fingerprinting	333
3.3. Statistical analysis of Raman spectra	334
3.3.1. Gaussian decomposition	334
3.3.2. Principal component analysis	337
3.4. Is Raman spectroscopy a quantitative tool?	338
4. Examples	339
4.1. Q^n species	339
4.1.1. Q^4 species	339
4.1.2. Q^3 species	340
4.1.3. Q^2 species	341
4.1.4. Q^1 species	342
4.1.5. Q^0 species	343
4.2. Other tetrahedrally-coordinated cations	344
4.2.1. Aluminium	344
4.2.2. Phosphorus	347
4.2.3. Ferric iron	349
4.2.4. Titanium	349
4.3. Volatiles in glass (C-O-H-N-S and halogens)	350
4.3.1. HO, H ₂ O, H ₂	351
4.3.2. C-bearing species in the COH system	353
4.3.3. N-bearing species in the NOH system.....	355
4.3.4. Sulphur species.....	357
4.3.5. Halogen-containing glass	357
5. Perspectives	358
References.....	358

Chapter 10. Raman spectroscopy at high pressure and temperature for the study of the Earth's mantle and planetary minerals

by BRUNO REYNARD, GILLES MONTAGNAC and HERVÉ CARDON	367
1. Introduction	367
2. Experimental setups for HP-HT Raman spectroscopy	368
2.1. Raman spectroscopy at high temperature	368
2.2. Raman spectroscopy at high pressure.....	371
2.3. Combining high pressure and high temperatures	372
3. Pressure- and temperature-induced variations of vibrational frequencies	373
3.1. Anharmonic shifts	373
3.2. Applications to vibrational modelling of thermodynamic properties from HP-HT measurements	377
3.3. Applications to pressure calibration in natural and experimental systems	379

4. Phase transitions	380
4.1. Irreversible and metastable phase transitions	380
4.2. Reversible transformation	382
5. Concluding remarks	384
Acknowledgements.....	384
References.....	384

Chapter 11. Raman spectroscopy in biogeology and astrobiology

by ISABELLE DANIEL and HOWELL G.M. EDWARDS	391
1. Introduction	391
2. Historical astrobiology	392
2.1. Astrobiology <i>versus</i> Exobiology.....	392
3. Advantages of Raman spectroscopy for the characterization of biomolecules and biogeological molecules	394
4. Database of key biomarkers.....	397
5. Laboratory experiments	398
5.1. Quantitative Raman spectroscopic measurement of microbial metabolic activity.....	398
5.2. Raman spectroscopy for probing live cells	400
5.3. Measurements of minute amounts of biological and biotic products	402
5.4. Raman microfluidic platforms.....	404
6. Raman instrumentation in biogeology and astrobiology.....	406
6.1. Scanning confocal Raman spectroscopy for laboratory experiments	406
6.2. Miniaturization of Raman instruments	406
6.3. Remote Raman spectroscopy for field work.....	407
7. Space exploration using Raman spectroscopy.....	407
7.1. Raman spectroscopy in the ExoMars mission	407
7.2. Experiments on the International Space Station.....	409
References.....	410

Chapter 12. Application of Raman spectroscopy to the study of graphitic carbons in the Earth Sciences

by OLIVIER BEYSSAC and MICHELE LAZZERI.....	415
1. Introduction	415
2. The Raman spectrum of graphitic carbons: theory	417
2.1. Why are the D and 2D peaks ‘unique’?	418
2.2. Basic concepts of quantum mechanics and perturbation theory	420
2.3. Electronic gap and resonant Raman	423
2.4. Fourth-order perturbation and double resonant Raman	423
2.5. Electronic structure and phonon dispersion in graphene/graphite	424
2.6. Double resonance in graphite	426

2.7. Attribution of the Raman peaks	428
2.8. Shape and width of the 2D peak.....	429
2.9. Intensity of the D peak and the Tuinstra-Koenig relation	430
3. Methodology: characterizing graphitic carbons using Raman microspectroscopy	431
3.1. Raman spectroscopy is a surface analysis in the case of graphitic carbons	432
3.2. Analytical strategy and sample preparation: how to minimize analytical artifacts?	432
3.3. The anisotropic structure of graphitic carbons and polarization effects	433
3.4. Dispersivity of the defect peaks and choice of a laser wavelength	435
3.5. Fitting spectra: how to retrieve quantitative information on the structure of graphitic carbons?	435
3.6. The intrinsic structural heterogeneity of natural graphitic carbons	437
4. Applications of Raman spectroscopy to the study of natural graphitic carbons.....	437
4.1. Carbonization/graphitization during terrestrial diagenesis/metamorphism	438
4.2. Graphitic carbons and fluid–rock interactions	440
4.3. Graphitic carbons as traces of life in the geological record	441
4.4. Graphitic carbons and cosmochemistry	444
4.5. Graphitic carbons and environmental sciences.....	446
5. Conclusions.....	447
Acknowledgements.....	447
References.....	448

Chapter 13. Raman spectroscopy applied to Gemmology

by EMMANUEL FRITSCH, BENJAMIN RONDEAU, THOMAS

HAINSWANG and STEFANOS KARAMELAS	455
1. Introduction	455
2. Raman spectroscopy applied to gems: strength and limitations	457
2.1. Why Raman spectroscopy is useful for gemmologists	457
2.2. Instrumentation	458
2.3. Limitations of Raman spectroscopy	459
2.3.1. Weak ‘Raman scatterers’.....	459
2.3.2. Artefacts and non-Raman signal.....	459
2.3.3. Competition with luminescence signals	461
2.3.4. Sampled volume	461
2.3.5. Keeping gemmology in mind when interpreting Raman spectra.....	461
3. Determination of the gem species	462

3.1. Macrosamples	462
3.2. Microsamples and inclusions	464
3.2.1. Identification of phases in fluid inclusions.....	466
3.2.2. Identification of inclusions due to a treatment	466
3.2.3. Identification of thin films covering gems.....	468
4. Determination of order-disorder: bandwidth considerations.....	469
5. Resonant Raman spectroscopy and the identification of some organic colouring agents.....	472
5.1. Parrodiene vs. carotenoids	472
5.2. Application to pearls and corals	473
5.2.1. Pearls	473
5.2.2. Corals.....	475
6. Raman spectrometers as photoluminescence instruments.....	477
6.1. Why do gemmological laboratories use Raman spectrometers for luminescence spectroscopy?	477
6.2. Instrumentation	477
6.3. Applications to gems.....	478
6.3.1. Photoluminescence spectroscopy of diamonds	478
6.3.2. Photoluminescence spectroscopy of other gem materials.....	480
7. Conclusions and perspectives	484
Acknowledgements.....	485
References.....	485

Chapter 14. Applications of Raman spectroscopy in Cultural Heritage research

by PETER VANDENABEELE	491
1. Introduction	491
2. Analysis of mediaeval manuscripts	493
3. Painting analysis.....	494
4. Direct Raman analysis and the use of mobile instrumentation.....	496
5. Combined method approaches	498
6. Conclusions.....	498
Acknowledgements.....	499
References.....	499
Subject and Author Index	501

Preface

JEAN DUBESSY¹, MARIE-CAMILLE CAUMON¹, and FERNANDO RULL²

¹ *UMR Géologie et Gestion des Ressources Minérales et Energétiques, FST, Université de Lorraine, BP-70239, 54506- Vandœuvre-les Nancy Cedex, France, e-mail: jean.dubessy@g2r.uhp-nancy.fr; marie-camille.caumon@univ-lorraine.fr*

² *Unidad Asociada UVA-CSIC, Cristalografía y Mineralogía, Universidad de Valladolid, 47006-Valladolid, Spain, e-mail: rull@fmc.uva.es*

In Earth Sciences and Cultural Heritage Science we can only understand the formation of the ‘objects’ if they are well characterized. Optical observation, including optical microscopy, is still the primary tool and is essential in obtaining a preliminary, qualitative determination of an object, to determine the relations between it and other objects, and to place it in a general context. Most of the time, however, optical observations are insufficient. Spectroscopic methods are the second “set of eyes” used to gain greater insight into these objects and to use physical chemistry, if applicable, to derive the mechanisms of formation. Spectroscopic methods are numerous and have been described in a previous volume (6) in the *EMU Notes in Mineralogy* series, edited by A. Beran & E. Libowitzky (2004). In chapter 7 of that volume, Raman spectroscopy was addressed by Nasdala *et al.* (2004). Though that volume provides a very useful means to gain a general understanding of the contribution of each spectroscopy to mineralogy, no details of the theory, instrumentation and applications to the different types of objects could be provided. In the past eight years, there have been many improvements in the instrumentation which makes Raman spectroscopy a versatile technique used in many Earth Science and Cultural Heritage laboratories and so it appeared appropriate to have a school and a book dedicated to Raman Spectroscopy alone.

Four main topics are addressed here:

(1) **Theory:** in Chapter 1, dedicated to the Raman effect, in Chapter 4, dealing with the modelling of Raman spectra, in Chapter 2 to the links between fluorescence and Raman spectroscopy, in Chapter 10 for the exploitation of Raman spectra of minerals at high pressure and temperature, and in Chapter 12 for the rationale behind Raman spectra of graphitic carbon compounds; the basic theory of the instrumentation is developed in Chapter 3.

(2) **Methodology including the instrumentation:** in Chapter 3 and the Raman data analysis in Chapter 5.

(3) **Experimental aspects:** for the investigation of Raman spectra at high pressure and temperature using diamond anvil cells for minerals (Chapter 10) and geological fluids (Chapter 7) and with fused silica capillary for fluids (Chapter 6).

(4) **Application:** to different types of objects: geological fluids (Chapter 8), silicate glasses and melts (Chapter 9), biogeology and astrobiology (Chapter 11), graphitic carbons (Chapter 12), gemmology with a link with fluorescence spectroscopy (Chapter 13), and Cultural Heritage (Chapter 14).

A given chapter may address several topics, as it is impossible to obtain relevant information from the Raman study of a given object without considering the theory for the interpretation of the spectra, or instrumental set-up including special cells, or handling raw spectra.

It is also clear that the whole theory could not be developed thoroughly with all the details as it deals with quantum mechanics and group theory. This would require at least two further volumes! Thus, chapters focused on the theoretical aspects are written with the aim of giving the main steps and the results obtained from the theory and how theory can be used for the interpretation of Raman spectra. Readers who want to know the details of the theory and their associated calculations should consult specialized textbooks or publications which are referred to in the chapters hereafter.

Foreword

The present volume of the EMU *Notes in Mineralogy* series describes the ‘Applications of Raman Spectroscopy to Earth Sciences and Cultural Heritage’. It is associated with the 12th EMU ‘school’ co-sponsored by the French Centre National de la Recherche Scientifique (CNRS) as a ‘thematic school’ and by the Société Française de Minéralogie et Cristallographie (SFMC).

The present volume contains chapters arising out of lectures given at this ‘school’ which was held at the Université de Lorraine (Nancy, France) from 14–16 June 2012, immediately after the GeoRaman X meeting.

Spectroscopic methods such as Raman are used to investigate the structure and dynamics of matter. They are essential for the study of the different types of mineral or organic materials produced at the Earth’s surface or interior. As a result of technological improvements in gratings, detectors, filters and personal computers in the last decade, many micro-Raman spectrometers have become plug-and-play instruments, very easy to use and available at a lower cost than the early Raman microprobes. Thus, many laboratories in Earth Sciences and Cultural Heritage are equipped with these new spectrometers. Commercial portable Raman spectrometers working in the field have also contributed to the spread of Raman spectroscopy. However, poor levels of education in terms of Raman spectroscopy in undergraduate courses in Earth Sciences make it difficult for individuals to obtain information of the highest quality relevant to Earth sciences and Cultural Heritage.

The bid by G²R (Géologie et Gestion des Ressources Minérales et Energétiques UMR 7566) to organize the GeoRaman X meeting and the associated school was accepted by the International GeoRaman meetings Scientific committee. Members of the SFMC council and especially its President, Anne-Marie-Karpoff who supported this proposition, are thanked for their support. Christian Chopin, vice-President of EMU and SFMC Council member suggested contact with the EMU with a view to attracting an international audience to the school. Roberta Oberti and Herta Effenberger, President and Secretary, respectively, of EMU, together with the EMU committee welcomed this proposition and subsequent publication of the lectures in the EMU *Notes in Mineralogy* series. The organizers are grateful to the ‘Institut National de l’Univers’ (CNRS) and the ‘Formation Permanente of CNRS’ for badging this event as a thematic CNRS school and to the Université de Lorraine for hosting the event. Many thanks to the contributing authors for publishing their chapters here, and to Kevin Murphy of the Mineralogical Society for his efficiency in the production of the volume. Finally, the editors are very grateful to Marie-Christine Boiron, Patrick Lagrange and Christine Leonard of the G2R laboratory for their help in organizing the school.
